

Polycom Zero Touch Provisioning Solution

To our valued Partners:

Seeing is Believing – Polycom simplifies VoIP device deployment

Polycom understands the challenges Service Providers face with device deployments to their customers. Zero Touch Provisioning (ZTP) is a cloud based provisioning solution designed to make it simple to deploy VoIP Devices (Polycom® Sound Point® IP, SoundStation® IP, VVX® and Spectralink® families of products).

By using ZTP, you enjoy reduced operational expense (OpEx) costs because it removes the need to either “open the box” at a distribution center or send skilled technicians to the customer site to enter in pre-provisioning information through their phone UI or web interface. This Polycom solution is primarily focused on Service Provider deployments in tandem with the activation and provisioning processes.

Benefits include:

- Simplified deployment for your peace of mind - Customer plug and play installation
- Reduced cost to deploy phone – No need to remove device from box before shipping to the end-user
- Improved tracking of phones
- Reduced configuration errors - No manual configuration
- Faster time from order to revenue for partners
- Improved flexibility for Polycom Partners to react to special orders
- Reduced number of SKUs

How it works:

When a Polycom VoIP device is initially installed at the customer site, it automatically contacts the Polycom ZTP server and downloads an initial configuration including the address of the Service Provider or enterprise provisioning server. This solution offering is consistent with Polycom’s vision of “simple device deployment”.
